mls file (one with -short, one with -migrate, and one without) + one text file with the.mls extension only, just to give you a visual on how the.mls file looks like on the iPad.Instructions: Attach the VPKs to the main.mls file, open the file using the following command: pkg translate. Import the resulting.mls file to a project (Import/Export are both called "Import");For the Apple Pencil, use the following command, replacing the VPK in the xcode commands by the VPK you added to the.mls file: xcode translate.cuboid xcode rename -xsvu -replace 'Viewpoint' 'Apple Pencil' -y 'Viewpoint' -replace 'Line' 'Apple Pencil' -replace 'Camera' 'Zoom' I am not very familiar with VPK, but if you use most of the features of the program, you can search for instructions on how to import/export the result of the program to one of the following files:.mls,.yaml,.ymli,.xml, and.cuboid. I am very new to VPK, but I believe the most important features for my application are the following:Multiplication scale, projection, depth, rotation, and background changes. I will show you my.mls file below: I put a scale of 2 for the multiplication feature. I will probably use it for 1, 5, 10, 25, and 100 times the base scale.Projection and rotation have been moved to the side because I do not need them for my project. I tried to add some background changes (in purple color) but because they are not supported by VPK, I have not been able to add them yet. But I will keep working on it. If you have any questions, just leave a reply and I will answer it for you. (I will show you the result in a few days. I am a little bit busy with my school now, but I will try to finish the project this week.) This is great. Thank you so much! I'm going to start working on a project that needs a lot of depth, and this may help me. I just tried the adjustment layer, and when I made the adjustment layer invisible, everything just stayed the same! So 82157476af
